

Homework 2: Decision Trees

Due 10/21 at 11:59pm

Note: There are two notebooks in Homework 2. Please also complete the other notebook `HW2_Linear_Models.ipynb` for full credit on this assignment.

Q4 : Decision Trees

Download the dataset from this website : <https://archive.ics.uci.edu/ml/machine-learning-databases/adult/adult.data> The data is a csv file with the following columns:

age: continuous.

workclass: Private, Self-emp-not-inc, Self-emp-inc, Federal-gov, Local-gov, State-gov, Without-pay, Never-worked.

fnlwgt: continuous.

education: Bachelors, Some-college, 11th, HS-grad, Prof-school, Assoc-acdm, Assoc-voc, 9th, 7th-8th, 12th, Masters, 1st-4th, 10th, Doctorate, 5th-6th, Preschool.

education-num: continuous.

marital-status: Married-civ-spouse, Divorced, Never-married, Separated, Widowed, Married-spouse-absent, Married-AF-spouse.

occupation: Tech-support, Craft-repair, Other-service, Sales, Exec-managerial, Prof-specialty, Handlers-cleaners, Machine-op-inspct, Adm-clerical, Farming-fishing, Transport-moving, Priv-house-serv, Protective-serv, Armed-Forces.

relationship: Wife, Own-child, Husband, Not-in-family, Other-relative, Unmarried.

race: White, Asian-Pac-Islander, Amer-Indian-Eskimo, Other, Black.

sex: Female, Male.

capital-gain: continuous.

capital-loss: continuous.

hours-per-week: continuous.

native-country: United-States, Cambodia, England, Puerto-Rico, Canada, Germany, Outlying-US(Guam-USVI-etc), India, Japan, Greece, South, China, Cuba, Iran, Honduras, Philippines, Italy, Poland, Jamaica, Vietnam, Mexico, Portugal, Ireland, France, Dominican-Republic, Laos, Ecuador, Taiwan, Haiti, Columbia, Hungary, Guatemala, Nicaragua, Scotland, Thailand, Yugoslavia, El-Salvador, Trinidad&Tobago, Peru, Hong, Holand-Netherlands.

target: >50K, <=50K.

1. Read the data into a dataframe and assign column names

```
In [54]: import pandas as pd
import matplotlib.pyplot as plt
import matplotlib.ticker as mtick
from sklearn.model_selection import train_test_split
from sklearn.compose import make_column_transformer
from sklearn.tree import DecisionTreeRegressor
from sklearn.preprocessing import StandardScaler, OneHotEncoder, OrdinalEncoder
from category_encoders import TargetEncoder
from sklearn.pipeline import make_pipeline
from sklearn import tree
from sklearn.model_selection import GridSearchCV

header_list = ["age", "workclass", "fnlwgt", "education", "education-num", "marital-status", "occupation", "relationship", "race", "target"]
read_file = pd.read_csv (r'/Users/Griffin/repos/assignment-2-klettg/adult.data')
read_file.to_csv (r'/Users/Griffin/repos/assignment-2-klettg/adult.csv', index=False)
df = pd.read_csv('/Users/Griffin/repos/assignment-2-klettg/adult.csv', names=header_list)
df.head(100)
```

Out[54]:

	age	workclass	fnlwgt	education	education-num	marital-status	occupation	relationship	race	target
0	39	State-gov	77516	Bachelors	13	Never-married	Adm-clerical	Not-in-family	White	<=50K
1	50	Self-emp-not-inc	83311	Bachelors	13	Married-civ-spouse	Exec-managerial	Husband	White	<=50K
2	38	Private	215646	HS-grad	9	Divorced	Handlers-cleaners	Not-in-family	White	<=50K
3	53	Private	234721	11th	7	Married-civ-spouse	Handlers-cleaners	Husband	Black	<=50K
4	28	Private	338409	Bachelors	13	Married-civ-spouse	Prof-specialty	Wife	Black	>50K
...
95	29	Local-gov	115585	Some-college	10	Never-married	Handlers-cleaners	Not-in-family	White	<=50K
96	48	Self-emp-not-inc	191277	Doctorate	16	Married-civ-spouse	Prof-specialty	Husband	White	<=50K
97	37	Private	202683	Some-college	10	Married-civ-spouse	Sales	Husband	White	<=50K
98	48	Private	171095	Assoc-acdm	12	Divorced	Exec-managerial	Unmarried	White	>50K

	age	workclass	fnlwgt	education	education-num	marital-status	occupation	relationship	race
99	32	Federal-gov	249409	HS-grad	9	Never-married	Other-service	Own-child	Black

100 rows × 15 columns

1. Plot % of missing values in each column. Would you consider dropping any columns?

Assuming we want to train a decision tree, would you consider imputing the missing values?

If not, why?

```
In [55]: length = len(df)
feature_df = df.drop('target', 1)
pct_null = []
for col in feature_df:
    pct_null.append(round(((length - len(feature_df[feature_df[col] != '?')) / length) * 100))

fig = plt.figure(figsize=(14, 14))
ax = fig.add_subplot(1,1,1)
ax.yaxis.set_major_formatter(mtick.PercentFormatter())
features = header_list[:-1]
x_pos = [i for i, _ in enumerate(pct_null)]

plt.bar(x_pos, pct_null)
plt.xticks(x_pos, features, rotation='vertical')
plt.ylabel('% Missing Values')
plt.xlabel('Column Label')
plt.title('% Missing Values Across Columns')
plt.show()
```

In [56]:

```
#2 Answer: I would consider dropping both workclass and occupation, since both of
their values. I would not considering imputing values since all three with miss
and in a decision tree model we may split the tree off the imputed value. I wi
since this contains the same information as the field education. Also
I will drop native-country since almost all the values are the same
and since there are so many categories, it would add a lot
of dimensionality with not so high information gain
```

```
feature_df = feature_df.drop('education-num', 1)
feature_df = feature_df.drop('native-country', 1)
```

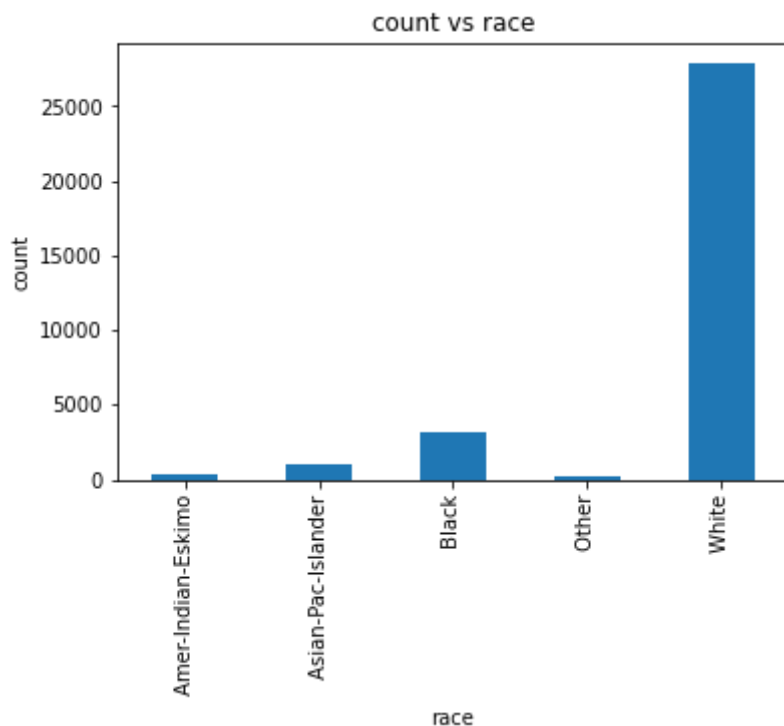

1. Pick 3 categorical features and for each categorical feature, plot side-by-side bars (horizontal or vertical) of class distribution for each category.

In [57]:

```
plt.figure()
```

```
count=0
columns_to_plot = ['workclass', 'occupation', 'race']
for col in columns_to_plot:
    df[col].value_counts().sort_index().plot(
        kind='bar', rot='vertical', ylabel='count',
        xlabel=col, title="count vs %s"%col)
plt.show()
```

1. Split the dataset into development and test datasets using 80/20 ratio

In [58]:

```
#Preprocessing
num_features = ['age', 'fnlwgt', 'capital-gain', 'capital-loss', 'hours-per-week']

ohe_features = ['workclass', 'marital-status', 'occupation', 'relationship', 'sex']

te_features = ['education']

enc = OrdinalEncoder()
ohe = OneHotEncoder(handle_unknown='ignore')
df[['target']] = enc.fit_transform(df[['target']])
df['target'] = df['target'].astype(int)

#scaler = StandardScaler()
#feature_df[num_features] = scaler.fit_transform(feature_df[num_features])
#feature_df[ohe_features] = ohe.fit_transform(feature_df[ohe_features])
#feature_df.head()
X_dev, X_test, y_dev, y_test = train_test_split(feature_df, df[['target']], rand
```

1. Fit a Decision Tree on the development data until all leaves are pure. What is the performance of the tree on development data and test data?

In [6]:

```
from sklearn.tree import DecisionTreeClassifier, plot_tree, export_graphviz
from graphviz import Source
clf = DecisionTreeClassifier(random_state=81)
preprocess = make_column_transformer((StandardScaler(), num_features),
                                     (OneHotEncoder(handle_unknown='ignore'), ohe_
                                     (TargetEncoder(handle_unknown='ignore'), te_f
                                     remainder="passthrough"
                                     )
                                     )
#pipe = make_pipeline(preprocess,
#                      clf)
```

```

#pipe.fit(X_dev, y_dev)
#print(f"Test score:", pipe.score(X_test, y_test))
#print(f"Train score:", pipe.score(X_dev, y_dev))

pipe = make_pipeline(preprocess,
                    GridSearchCV(clf,
                                param_grid = {},
                                return_train_score=True))

pipe.fit(X_dev, y_dev)
grid_search_results = pipe.named_steps['gridsearchcv']
print(f"Best train score: ", grid_search_results.best_score_)
print(f"Best train alpha: ", grid_search_results.best_params_)
print(f"Test score:", pipe.score(X_dev, y_dev))
plt.figure(figsize=(30,50))
best_tree = grid_search_results.best_estimator_

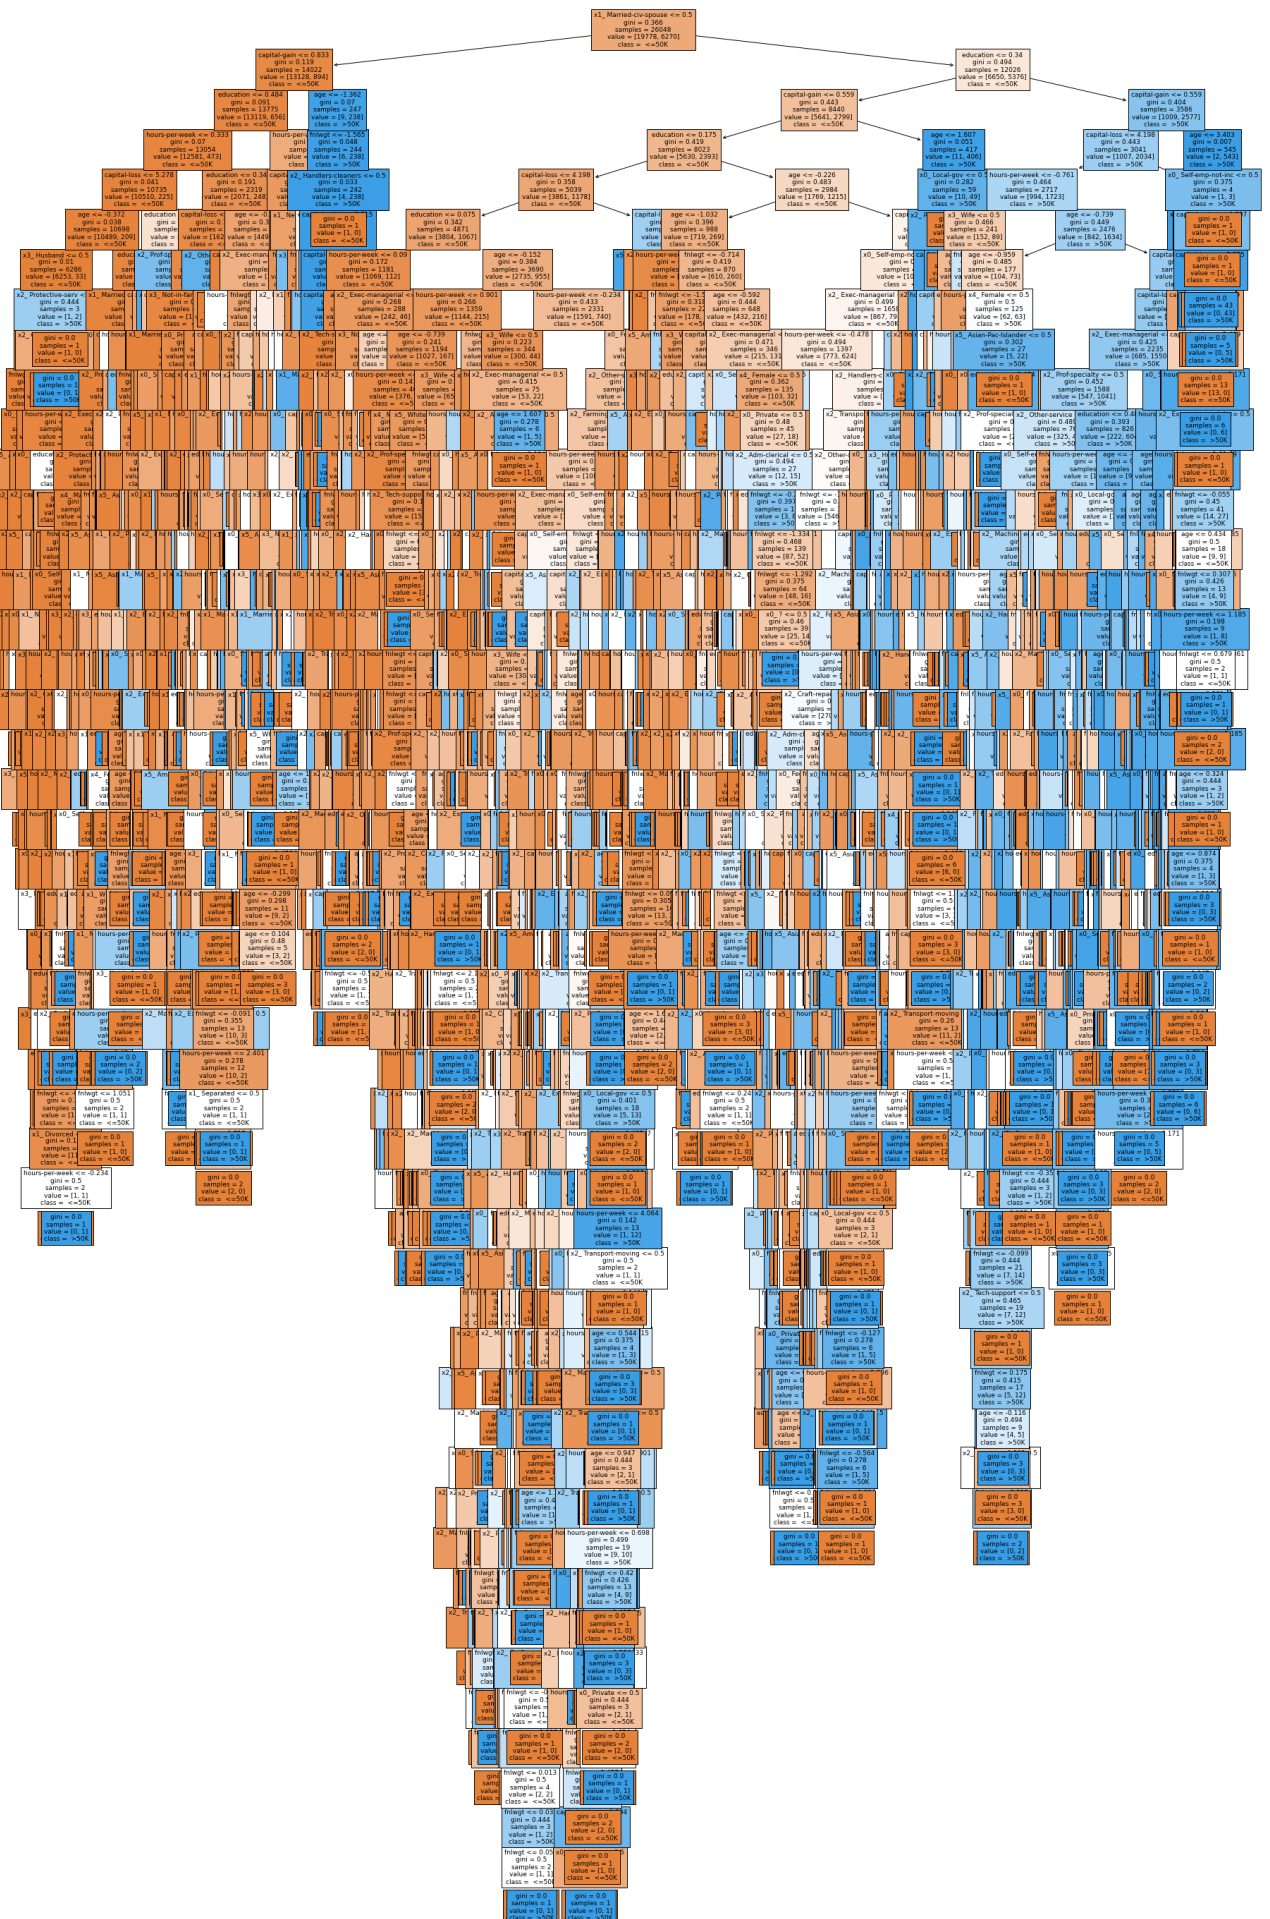

ohe_feature_names = preprocess.named_transformers_["onehotencoder"].get_feature_
te_feature_names = preprocess.named_transformers_["targetencoder"].get_feature_n
feature_names = num_features + ohe_feature_names + te_feature_names
target_values = [" <=50K", " >50K"]
tree_dot = plot_tree(best_tree, feature_names=feature_names, fontsize=9, filled=
plt.show()

```

```

Best train score:  0.8125002754349939
Best train alpha:  {}
Test score: 1.0

```

1. Visualize the trained tree

```
In [ ]: print(tree.export_text(clf))
```

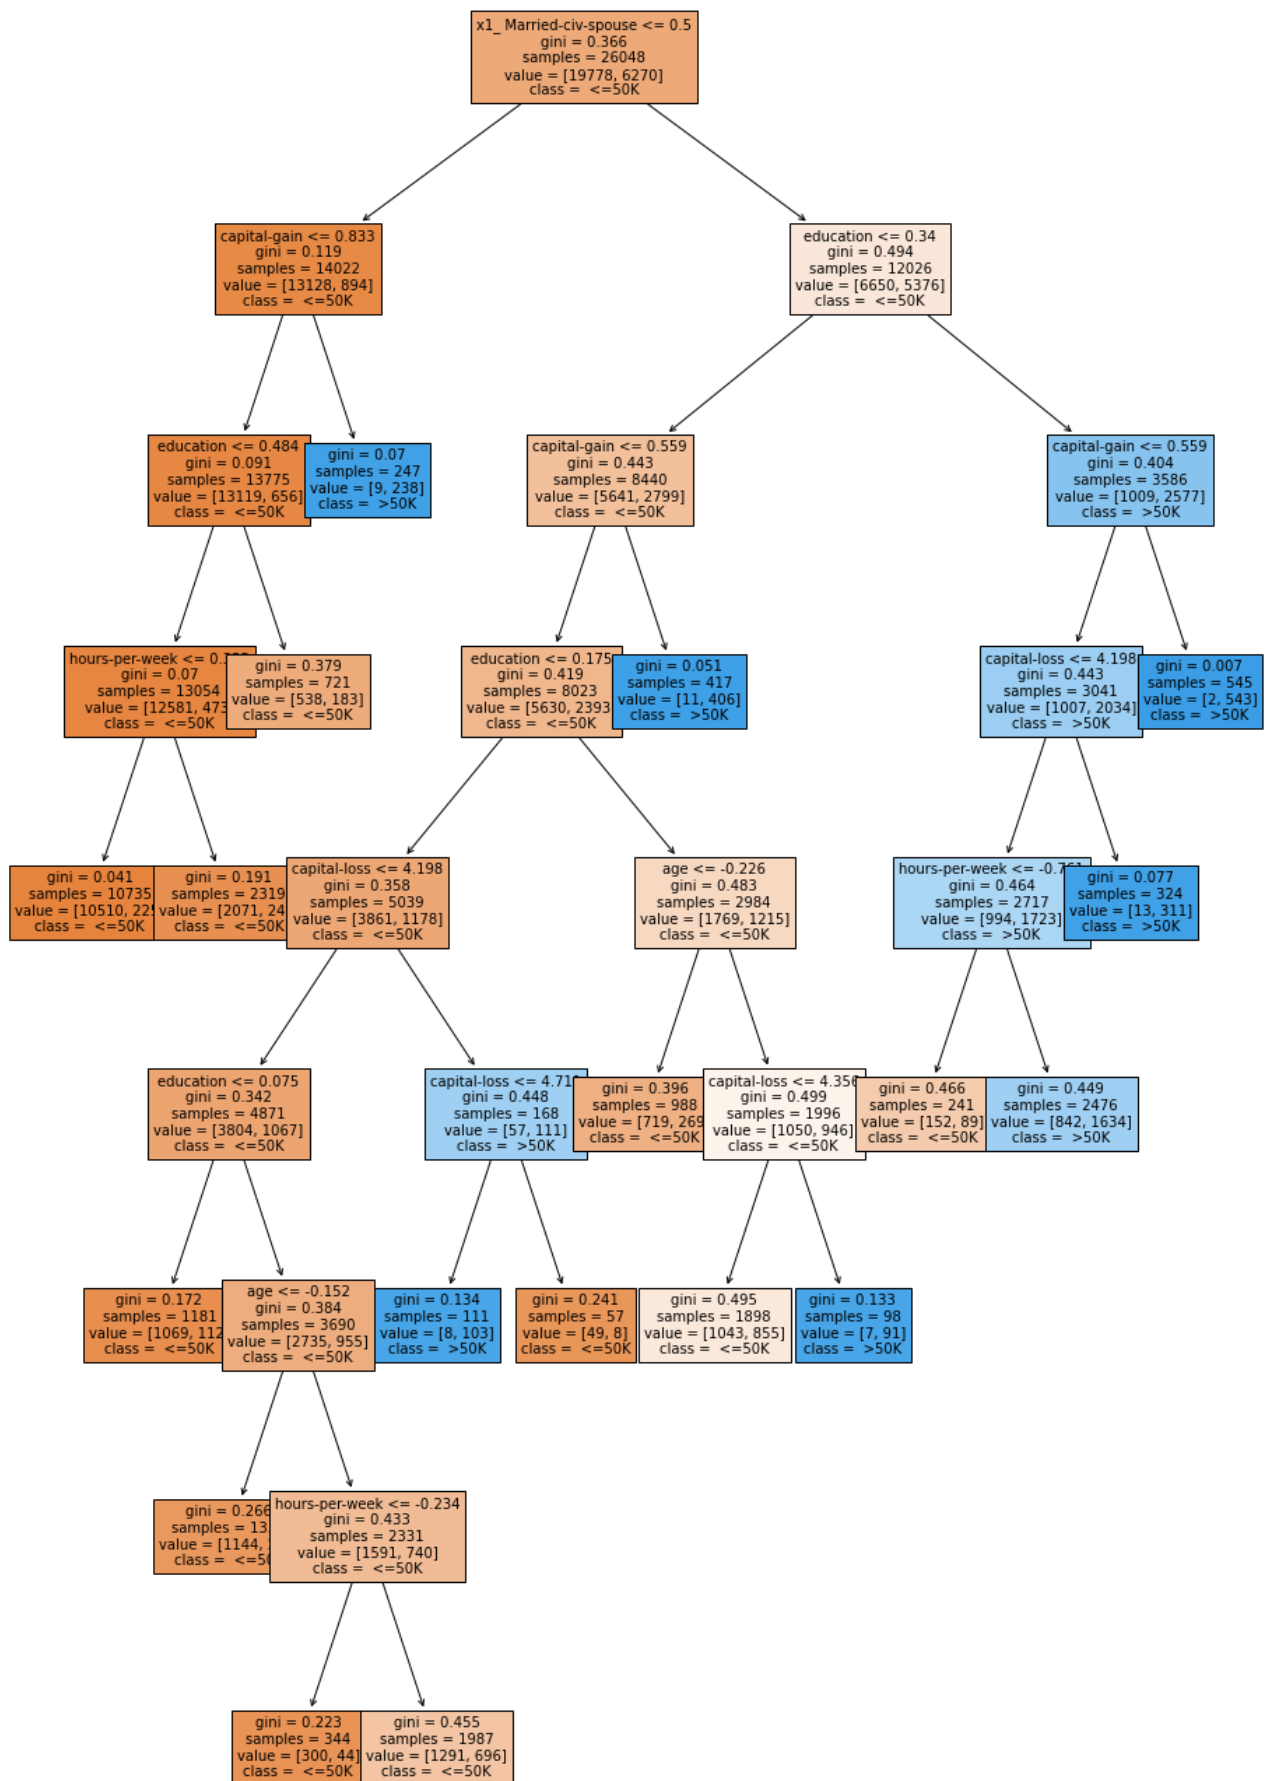

1. Prune the tree using one of the techniques discussed in class and evaluate the performance on the test set again.

```
In [60]: import numpy as np
from sklearn.tree import DecisionTreeClassifier, plot_tree, export_graphviz
clf = DecisionTreeClassifier(random_state=81)
preprocess = make_column_transformer((StandardScaler(), num_features),
                                     (OneHotEncoder(handle_unknown='ignore'), ohe_
                                     (TargetEncoder(handle_unknown='ignore'), te_f
                                     remainder="passthrough"
                                     )
pipe = make_pipeline(preprocess,
                    GridSearchCV(clf,
                                param_grid = [{"min_impurity_decrease": np.logspa
                                return_train_score=True}))

pipe.fit(X_dev, y_dev)
grid_search_results = pipe.named_steps['gridsearchcv']
print(f"Best train score: ", grid_search_results.best_score_)
print(f"Best train alpha: ", grid_search_results.best_params_)
print(f"Test score:", pipe.score(X_test, y_test))
plt.figure(figsize=(16,25))
best_tree = grid_search_results.best_estimator_

ohe_feature_names = preprocess.named_transformers_["onehotencoder"].get_feature_
te_feature_names = preprocess.named_transformers_["targetencoder"].get_feature_n
feature_names = num_features + ohe_feature_names + te_feature_names
target_values = [" <=50K", " >50K"]
tree_dot = plot_tree(best_tree, feature_names=feature_names, fontsize=10, filled
plt.show()

Best train score: 0.8521960993983173
Best train alpha: {'min_impurity_decrease': 0.001}
Test score: 0.8542914171656687
```

1. List the top 3 most important features for this trained tree? How would you justify these features being the most important?

In [61]:

```
import seaborn as sns
fig, ax = plt.subplots()
# the size of A4 paper
fig.set_size_inches(11.7, 8.27)
ohe_feature_names = preprocess.named_transformers_["onehotencoder"].get_feature_names_
te_feature_names = preprocess.named_transformers_["targetencoder"].get_feature_names_
feature_names = num_features + ohe_feature_names + te_feature_names
featimps = zip(feature_names, best_tree.feature_importances_)
feats,imps = zip(*(sorted(list(filter(lambda x: x[1] != 0, featimps)), key=lambda x: x[1])))
ax = sns.barplot(list(feats), list(imps))
ax.tick_params(axis='x', rotation=90)
ax.set_ylabel('feature importance')
ax.set_xlabel('feature')
ax.set_title('feature importance across features')
#Answer:
# : Married/spouse status, education, capital-gain. We can see this using the decision
# feature_importance as well as visually from the tree. These features are at the top
# which is gives us the highest impurity splits (most predictive of value)
```

```
/Users/Griffin/opt/anaconda3/lib/python3.8/site-packages/seaborn/_decorators.py:
36: FutureWarning: Pass the following variables as keyword args: x, y. From version 0.12, the only valid positional argument will be `data`, and passing other arguments without an explicit keyword will result in an error or misinterpretation.
```

```
warnings.warn(
```

Out[61]: Text(0.5, 1.0, 'feature importance across features')

Q5: Random Forests

Let's use the same dataset and the splits created in Q3.

1. Train a Random Forest model on the development dataset using RandomForestClassifier class in sklearn. Use the default parameters. Evaluate the performance of the model on test dataset. Does this perform better than Decision Tree on the test dataset (compare to results in Q 4.5)?

```
In [15]: from sklearn.ensemble import RandomForestClassifier
rf = RandomForestClassifier(random_state=81)
preprocess = make_column_transformer((StandardScaler(), num_features),
                                     (OneHotEncoder(handle_unknown='ignore'), ohe_
                                     (TargetEncoder(handle_unknown='ignore'), te_f
                                     remainder="passthrough"
                                     )
pipe = make_pipeline(preprocess,
                    GridSearchCV(rf,
                                param_grid = [{ }],
                                return_train_score=True))

pipe.fit(X_dev, y_dev)
```

```

grid_search_results = pipe.named_steps['gridsearchcv']
print(f"Best train score: ", grid_search_results.best_score_)
print(f"Best train alpha: ", grid_search_results.best_params_)
print(f"Test score:", pipe.score(X_test, y_test))

```

*#ANSWER: Yes the random forest performs slightly better than the decision tree f
#with accuracy 86.3% vs 85.4%*

```

```

```

<Figure size 1152x1800 with 0 Axes>

```

1. Does all trees in the trained random forest model have pure leaves? How would you verify this?

In [22]:

```

tree_dot = plot_tree(grid_search_results.best_estimator_.estimators_[0],
                      filled=True)
plt.show()

```

*#Yes all the trees in random forest have pure leaves. You can verify
#This by plotting individually one (or all) of the trees that comprise
#the random forest, or by looking at the default params on sklearn
#we see that the max_depth default is none, so nodes are expanded
#until all leaves are pure, and the default min_samples_split = 2
#(so we would split until each leaf has one value if it is not pure yet)*

1. Assume you want to improve the performance of this model. Also, assume that you had to pick two hyperparameters that you could tune to improve its performance. Which hyperparameters would you choose and why?

In []:

```
#I would search over different values for # of trees and # of features
#given to each tree. These values should vary based on our dataset sample
#size, and our specific dataset's number of features, so they make great
#candidates to have impact on overall performance
```

1. Now, assume you had to choose upto 10 different values (each) for these two hyperparameters. How would you choose these values that could potentially give you a performance lift?

In [62]:

```
#For this part, I would choose values spaced evenly larger and smaller
#than the default hyperparameter values. If further optimization is required
#you could then perform a further search around the area that give you
#the best scores off of the first optimization.
```

1. Perform model selection using the chosen values for the hyperparameters. Use cross-validation for finding the optimal hyperparameters. Report on the optimal hyperparameters. Estimate the performance of the optimal model (model trained with optimal hyperparameters) on test dataset? Has the performance improved over your plain-vanilla random forest model trained in Q5.1?

In [26]:

```
from sklearn.ensemble import RandomForestClassifier

rf = RandomForestClassifier(random_state=81)
preprocess = make_column_transformer((StandardScaler(), num_features),
                                     (OneHotEncoder(handle_unknown='ignore'), ohe_
                                     (TargetEncoder(handle_unknown='ignore'), te_f
                                     remainder="passthrough"
                                     )

n_estimators = [ 50, 100, 150]
n_features = [4, 8, 12]

pipe = make_pipeline(preprocess,
                    GridSearchCV(rf,
```

```
param_grid = [{'n_estimators': n_estimators,
               'max_features': n_features}],
return_train_score=True,
n_jobs=2))
```

```
pipe.fit(X_dev, y_dev)
grid_search_results = pipe.named_steps['gridsearchcv']
print(f"Best train score: ", grid_search_results.best_score_)
print(f"Best train alpha: ", grid_search_results.best_params_)
print(f"Test score:", pipe.score(X_test, y_test))
```

```
/Users/Griffin/opt/anaconda3/lib/python3.8/site-packages/sklearn/model_selection/_search.py:880: DataConversionWarning: A column-vector y was passed when a 1d array was expected. Please change the shape of y to (n_samples,), for example using ravel().
```

```
self.best_estimator_.fit(X, y, **fit_params)
Best train score: 0.8572638600915514
Best train alpha: {'max_features': 8, 'n_estimators': 50}
Test score: 0.8615077537233226
```

#Best train alpha: {'max_features': 8, 'n_estimators': 50}
#Test score: 0.8615077537233226
```

1. Can you find the top 3 most important features from the model trained in Q5.5? How do these features compare to the important features that you found from Q4.8? If they differ, which feature set makes more sense?

In [27]:

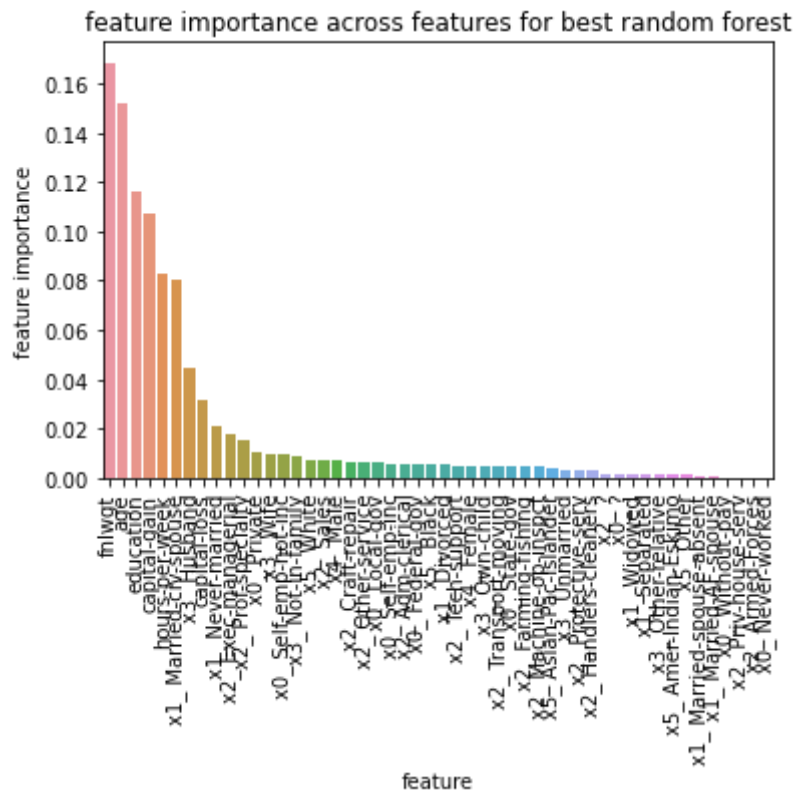

```
best_rf = grid_search_results.best_estimator_
featimps = zip(feature_names, best_rf.feature_importances_)
feats, imps = zip(*(sorted(list(filter(lambda x: x[1] != 0, featimps))), key=lambda x: x[1]))
ax = sns.barplot(list(feats), list(imps))
ax.tick_params(axis='x', rotation=90)
ax.set_ylabel('feature importance')
ax.set_xlabel('feature')
ax.set_title('feature importance across features for best random forest')
```

```
#ANSWER: The features are different here for random forest - fnlwgt, age, and education
# with education, captial-gain, and married-spouse status all in top 5.
# I think these make less sense than the decision tree. Perhaps these are more i
# because of how the random forest interactions took place, and how the features
# the smaller trees within the forest.
```

```
/Users/Griffin/opt/anaconda3/lib/python3.8/site-packages/seaborn/_decorators.py:
36: FutureWarning: Pass the following variables as keyword args: x, y. From vers
ion 0.12, the only valid positional argument will be `data`, and passing other a
rguments without an explicit keyword will result in an error or misinterpretatio
n.

Q6: Gradient Boosted Trees

Let's use the same dataset and the splits created in Q3.

1. Choose three hyperparameters to tune GradientBoostingClassifier and HistGradientBoostingClassifier on the development dataset using 10-fold cross validation. Report on the time taken to do model selection for both the models. Also, report the performance of the test dataset from the optimal models.

In [13]:

```
from sklearn.ensemble import GradientBoostingClassifier
learning_rate = [.01, .1, .2]
n_estimators = [50, 100, 200]
max_depth = [2, 3, 6]

gbc = GradientBoostingClassifier(random_state=81)
preprocess = make_column_transformer((StandardScaler(), num_features),
                                      (OneHotEncoder(handle_unknown='ignore'), ohe_
                                       (TargetEncoder(handle_unknown='ignore'), te_f
                                        remainder="passthrough"
                                       )
                                      )

pipe = make_pipeline(preprocess,
                    GridSearchCV(gbc,
                                param_grid = [{'learning_rate': learning_rate,
                                                'n_estimators': n_estimators,
                                                'max_depth': max_depth}],
                                return_train_score=True,
                                cv=10,
                                n_jobs=2))

1. Compare the results on the test dataset from XGBoost, HistGradientBoostingClassifier, GradientBoostingClassifier with results from Q4.5 and Q5.5. Which model tends to perform the best and which one does the worst? How big is the difference between the two? Which model would you choose among these 5 models and why?

```
In [15]: # XGBOOST: Test score - 0.871391584186148
# HISTGRADIENTBOOSTINGCLASSIFIER: Test score - 0.8780899738983571
# GRADIENTBOOSTINGCLASSIFIER: Test score - 0.8757868877629357
# 4.5 Default Decision Tree: Test score - 0.8125002754349939
# 5.5 Optimized Random Forest: Test score - 0.8615077537233226
# HISTGRADIENTBOOSTINGCLASSIFIER seems to perform the best, but the margin is ve
# I would likely choose the histgradientboostingclassifier since it runs much fa
# and also has the best performance on the test set!
```

1. Can you list the top 3 features from the trained XGBoost model? How do they differ from the features found from Random Forest and Decision Tree? Which one would you trust the most?

```

Q7: Calibration

Let's use the same dataset and the splits created in Q3. Let's use the XGBoost model that you trained in Q6.2.

1. Estimate the brier score for the XGBoost model (trained with optimal hyperparameters from Q6.2) scored on the test dataset.

In [64]:

```

from sklearn.metrics import brier_score_loss
xgb_best_estimator = grid_search_results_xgb.best_estimator_

#xgb_best_estimator.fit(X_dev,y_dev)
#print(xgb_best_estimator.feature_importances_)
#predictions = xgb_best_estimator.predict(X_test)
#brier_score = brier_score_loss(predictions, y_test)

```

```
